INNOFINITY WORLDWIDE

Admin section | Backend handover brief

Objective: Rebuild the existing CI3 admin using Angular, Java and PostgreSQL while preserving current business functions.

Basis: Modules below are confirmed by the supplied sidebar. Field details and workflows must be verified against existing screens/source code. Described behaviour is a scope outline, not a verified API specification.

1. Website content and catalogue

Section	Purpose / scope
Slider	Manage website banners. Menus: List, Add New, Setting. Confirm image, text, link, visibility and ordering fields.
Pages	Manage website content pages. Menus: Page List, Add Page. Confirm editor, URLs, images and SEO fields.
FAQ	Manage questions and answers. Menus: FAQ List, Add New, Setting.
Testimonials	Manage customer reviews. Menus: Testimonial List, Add New, Setting.
Network	Manage network records. Menus: Network List, Add New, Setting. Confirm links to devices and pricing.
Sell Management	Three submodules: **Device, Attribute, Model**. Each has List, Add New and Setting. Confirm device/model relationships, attributes, conditions and valuation rules. Attribute routes use storage; confirm whether other attribute types exist.
Apple Laptops	Separate module with Apple Laptop List and Add New. Confirm specifications, pricing and relationship with sell/shop journeys.
Shop Management	Three submodules: **Device, Model, Product**. Each has List, Add New and Setting. Confirm product images, specifications, variants, prices and stock handling.
Popular Selling Models	Manage featured selling models. Menus: Models List, Add New, Setting. Confirm model selection and display ordering.

Admin operations & integration

2. Business and account management

Section	Purpose / scope
Dashboard	Business overview. Suggested counts: sell orders, buy orders, users and enquiries. Final metrics to be agreed.
Orders	Separate **Sell Order** and **Buy Order** lists. Confirm detail screens, allowed actions, status changes, payment/payout information and notifications.
Users	Manage registered customers. Confirm editable fields, account controls and related-order access.
Enquiries	View contact submissions. Confirm whether replies, status tracking or deletion are supported.
Settings	Global website configuration. Identify actual settings from the existing screen; separate public values from private credentials.
Admin Account	Admin login, change password and logout. Separate admin access from customer management.

3. Shared Java API requirements

- **Access:** Authenticated admin APIs, server-side authorization and input validation on every protected operation.

- **Lists and forms:** Pagination, search and sorting where relevant; create, view, update and delete actions according to existing workflows.

- **Integration:** Agreed request/response fields, consistent validation errors, upload rules and documentation for Angular integration.

- **Business rules:** Backend-controlled valuations, order transitions and payment/payout decisions. Preserve historical order details and protect referenced records from deletion.

- **Migration:** Preserve existing data relationships, uploaded images and website URLs.

4. Confirm before implementation

Review existing add/edit forms, module settings and order details. Prioritise device valuation, product variants, Apple laptop handling, order processing and payment/payout workflows.

Outside current sidebar scope: Gallery, Newsletter and the standalone Shop Order menu are commented out. Buy Order remains included under Orders.
